Program Aim

In studies of Computer Science, Artificial Intelligence (AI) or machine intelligence is the intelligence demonstrated by machines, in contrast to the natural human intelligence. AI in healthcare is the use of complex algorithms and software to emulate human cognition in the analysis of complicated medical data. More specifically, it inculcates the ability to design computer algorithms to reach clinical conclusions without direct human expertise. The objective of this FDP programme is to hold a platform of discussion on various AI tools and techniques in healthcare applications. The FDP also aims to demonstrate hands-on-session for the participants to get started designing, developing and using such systems.
